Mission

The Lincoln Trail District Health Department provides assurance of the public's health and safety through assessment, intervention and preparedness.

Lincoln Trail District Health Department is pleased to provide you with the annual report card. We hope you find this data helpful as you assess the community in which you serve, live, work, and play. Assessment is a key step in identifying our current state of health, the risk factors that threaten health and safety, and developing strategies for improving the quality and quantity of our lives. Lincoln Trail District Health Department strives to assist the communities we serve in identifying areas of improvement around health and safety as well as mobilizing the community to take action to protect everyone's foundational right to good health and a safe environment. We believe that we can make a positive difference in the lives of those we serve as a regional public health agency.

A handwritten signature in black ink that reads "Sara Jo Best". The signature is written in a cursive, flowing style.

Sara Jo Best, MPH
Public Health Director
Lincoln Trail District Health Department

Definitions:

Age-adjusted rate – The hypothetical death rate that would have occurred if the observed age specific rates were present in a population whose age distribution were that of a standard population.

Age-adjusted death rate

Sum of (age specific death rate per 100,000 population x standard population in corresponding age group)

(Sum of the standard population).

Crude and age-adjusted death rate – The crude rate indicates the true current “risk of dying” in a population. However, since the crude death rate is influenced by the age composition of a population as well as by the number of deaths by age group, the crude rate is not appropriate for comparisons between different populations. The age-adjusted death rate is used to indicate the relative risk of dying among different populations by relating them to a standard population. By removing the influence of the age composition, the age-adjusted rate allows for valid comparisons between two populations.
